

A decorative graphic consisting of four horizontal white lines of varying lengths, with a white curved arrow pointing upwards from the left side towards the top right.

Tendencias e Innovación en Printed Electronics para sector Ferroviario

Functional Printing & Embedded Devices Unit

"innovating for business"

Quite a challenge ...which opens up great opportunities

Our interdisciplinary capabilities enable us to address complex challenges.

Industrial Area

1. Advanced materials and new manufacturing processes
2. **Functional Printing & Embedded Devices**
3. Collaborative and cognitive robotics
4. Functional textiles
5. Chemicals
6. Modelling and simulation
7. Product development

Digital Area

1. Sensor systems and IoT
2. Data science and analytics
3. Artificial intelligence
4. Cybersecurity
5. Multimedia technologies
6. Digital Health

Biotechnology Area

1. Nutrition and health
2. Omic sciences
3. Biotechnology

Sustainability Area

1. Water
2. Soil
3. Air
4. Energy
5. Waste
6. Environmental impact
7. Batteries
8. Climate change

An interdisciplinary group focused on thin-film printed, flexible and hybrid devices embedded into smart surfaces and objects.

Printed Health & Environmental Sensors

Design and development printed devices with adhoc functionalities to tackle major issues in health and environmental monitoring

Printed Energy Devices

Design and development of ad hoc printed devices for energy harvesting, generation & conversion with emphasis in green hydrogen technologies

In Mould Electronics

Design and manufacturing of functional and decorative films for plastic, composites, silicone and elastomers devices integration.

Smart Engineering

Design and development of embedded systems and IoT devices to fulfill any need in the industry, smart cities or health/medical environment.

+40 Projects in execution

9 Tech Patents

+30 papers

5 Labs. From research to industrial preseries

Printed electronics enables the production of flexible and large-area components and complements silicon electronics.

Printed electronics enables the production of flexible and large-area components and complements silicon electronics.

lightweight

flexible

thin

robust

Large area

stretchable

Less carbon foot

These **key features distinguish** organic and printed electronics from traditional semiconductor technologies.

The CARBODIN project, coordinated by Eurecat, has the objective to contribute to the next generation of passenger trains that will be lighter and more energy and cost efficient than the current ones.

Eurecat participates in design of molds, modular floor development and printed wires integration for low voltage circuits inside composite panels.

Strain gauges printed on foils 2D or in 3D shapes for structural health monitoring

The objective of **3DELECPRINT** is to develop an integrated flexible robotic platform to print electronic sensors and/or cables on geometric complex rigid parts in 3D.

The resulting parts are made of different materials, including metal, composites, and ceramic.

The printing system to be used for the project is based on a spray head for ultrasound. This is a versatile technique enabling the use of a wide variety of dyes, with perfect adaptation to the shape of the substrate and a more efficient use of resources given that it works with very low movements.

Programme and call for tender

A project financed by the MINISTRY OF ECONOMY, INDUSTRY AND COMPETITIVENESS and by the European Union, as part of the Challenges-Collaboration tender under the State Investigation, Development and Innovation Programme for Challenges in Society. This forms part of the 2013-2016 State Science, Technical and Innovation Plan, the mission of which is to foster technological development and quality innovation.

The FLEXIRAPIDMAN project aims at the **development and maturation of flexible and rapid manufacturing technologies for mobility sub-sectors**, such as air or road transport, as well as **researching on design methodologies for additive manufacturing**, including generative design and the topological optimization of the components.

In the field of aeronautics, the research will focus on studying the feasibility of the production of aircraft parts, currently mechanized, by additive printing using the SLM technique (Sintering Laser Melting) and, promoting the use of the ISF technology (Incremental Sheet Forming) for manufacturing 3D parts, tools and sensors for aeronautical systems by means of additive electronic printing.

As part of the automotive research line, the project aims to demonstrate the feasibility of the sensorization and manufacturing of auxiliary tools by LMD (Laser Metal Deposition), manufacture closed foaming moulds with FDM technology (Fused Deposition Modelling), use the ISF technology (Incremental Sheet Forming) for the development of 3D pieces with advanced steels or the DMLS technology (Direct Metal Laser Sintering) for the manufacture of stamping dies. We will also investigate the printing of extensor gels by means of print electronics.

General details

Project

FLEXIRAPIDMAN - Maturation and development of efficient manufacturing technologies, fast and flexible, applied to the mobility sector

Project reference

CDTI IDI-2017 1014

Programme and call for tender

Project funded by the call CEN 2017 of CDTI (Centre for Technological and Industrial Development) and cofunded by the Fondo Europeo de Desarrollo Regional (FEDER).

Printed strain gauges on 3D surfaces

From a single gauge To a sophisticated design to compensate for the effect of temperature

Flexible self-regulating printed heaters to integrate into furniture

Printed & integrated light in plastic, textile & composites

Non-contact capacitive sensors for indoor use in the railway sector

Smart Touchless Sensors with embedded AI

Gesture recognition with embedded Artificial Intelligence algorithms with digital output in switches to adapt them to the new needs detected in the market (non-contact-high influx of people)

Printed Electronics
